

4. Áp dụng phương pháp PAW vào Writing Task 2

Bài mẫu

Working overtime is increasingly common for employees in many different parts of the world. While this rise can be attributed to a desire for greater financial gains, this may bring more harm than good to people because of its negative impact on people's health.

By working longer hours, individuals have the opportunity to complete a greater number of tasks, therefore boosting their potential for higher earnings. In the present day, the cost of living has significantly increased compared to previous times, affecting not only cities but also rural regions. Thus, by generating a higher income, workers may meet their financial needs and maintain their standard of living. For example, a significant number of manufacturing workers in Vietnam regularly work more hours to complete more jobs. By engaging in this activity, individuals have the opportunity to increase their income, hence enabling them to meet the exorbitant expenses associated with urban living, such as housing, food, and education for their offspring.

Irrespective of the significantly larger earnings that workers may receive, there are still multiple health issues that arise from working excessive hours. Excessive labour might lead to a scarcity of leisure time. Prolonged continuation of this condition may have a detrimental effect on people's health, leading to a decline in overall quality of life. Many studies shown that labourers in Vietnam frequently experience health ailments, including stress, migraines, and hypertension, as a result of enduring 12-hour work shifts. These health issues hinder their ability to derive pleasure from their personal life and diminish their overall state of well-being.

In conclusion, working extra hours provides people with a higher likelihood of a higher income; however, it also can lead to a multitude of health complications. The idea of spending longer hours at work, therefore, should be considered carefully.
